

Project Proposal

Stone Ticket OCR & Automated Invoicing System

Prepared for: Jarrod Thorne, Nova Construction **Prepared by:** Alex Gamble **Date:** June 24, 2026

Project Overview

Nova Construction currently processes 1,000+ delivery tickets per month through a largely paper-based system. The goal of this project is to build a web application that allows truck drivers and office staff to digitally upload their respective ticket copies. The system will automatically extract ticket data using OCR, compare the two copies for accuracy, flag any mismatches for review, and generate invoices for matched tickets — dramatically reducing manual labour and the risk of lost revenue from missing paper slips.

Scope of Work (MVP)

The following features are included in this proposal:

- Secure login with separate roles for drivers, office staff, and admin
- Ticket image upload for both drivers (mobile-friendly) and office staff (desktop), including bulk upload
- Automatic OCR extraction of ticket fields (date, plate number, material type, gross, tare, net weight, etc.)
- Automatic matching between driver and office copies of the same ticket
- Manual review queue for any tickets with mismatched or unreadable data
- Invoice PDF generation and download for fully matched tickets
- Cloud storage for all uploaded ticket images and generated invoices
- Basic ticket search and dashboard for office staff
- Deployment and handoff

Any features beyond this scope will be discussed and quoted separately before work begins.

Development Cost

Hourly rate	\$40 CAD/hour
Estimated hours	~180 hours
Project total	\$7,200 CAD

Plus applicable taxes. Any approved additions beyond the MVP scope will be quoted separately.

Payment Schedule

Milestone	Due	Amount
Project kickoff	Upon agreement	\$2,160 CAD (30%)
Working prototype	Login, upload, and dashboard functional	\$2,880 CAD (40%)
Final delivery	OCR pipeline, matching, invoicing, and deployment complete	\$2,160 CAD (30%)

Estimated Timeline

Approximately **2 to 3 months** from project start to MVP delivery.

Monthly Running Costs

The app relies on a set of third-party cloud platforms. I will handle account setup for each service. The pricing below reflects current public rates, which are published in USD.

Service	Purpose	Estimated Monthly Cost
Cloudflare Pages	Hosts the web application	\$0/month (free plan)
Cloudflare Workers	Runs backend logic — OCR pipeline, ticket matching, invoice generation	~\$5 USD/month
Cloudflare R2	Long-term storage for ticket images and invoice files	~\$0–\$2 USD/month
Google Vision (OCR)	Extracts data from uploaded ticket images	First 1,000 images/month free, then ~\$1.50 USD per 1,000 images
Supabase	Database, user authentication, and access management	~\$25 USD/month

Estimated monthly total: approximately \$30–\$40 USD/month at typical production usage.

Running costs scale gradually with usage. The two main cost drivers are OCR volume (number of images processed) and long-term storage growth. Both are pay-as-you-go and will stay modest at 1,000–2,000 tickets per month.

Proposed Technology

Layer	Technology
Frontend	React + Vite
Hosting	Cloudflare Pages
Authentication & Database	Supabase
Image & Invoice Storage	Cloudflare R2
OCR	Google Vision Document Text Detection
Backend Logic	Cloudflare Workers
Source Control	GitHub
